Eight years of full-stack engineering along two tracks: **financial-grade backend architecture** and **AI-driven development workflows**. Core developer at Webull, a 10M+ user brokerage (account compliance, in-house clearing migration, cell-based architecture). Most recently built a **15-person AI SDD team** from scratch: a Claude Code spec-driven pipeline that lifted delivery velocity **+300%** with sustained **99%** production availability, while leading a company-wide migration from Node to Java (6 → 3 months, zero major incidents). Operating principle: AI for generation, human judgment for the gates.

Core Strengths CORE STRENGTHS

SKILL · A AI SDD Development System

End-to-end Claude Code pipeline: AI-drafted templated specs → engineer review gate → implementation → automated tests with the spec as acceptance baseline; ops agent matrix; knowledge base + MCP so new hires ship in 3 days

SKILL · C High-Throughput Data Systems

Ad tracking at 6M daily / 70M peak PV: accept-only ingestion plus message-queue async processing; hot/cold attribution storage extended from 1 to 7 days; Redis cluster memory governance

SKILL · B Financial-Grade Architecture

Cell-based (unitized) systems with GZone, canary cells and a shared platform base; full account-lifecycle compliance and risk control; million-user clearing migration; 10M-scale end-of-day batch and reconciliation

SKILL · D Team & Engineering Culture

Architecture decisions, hiring and culture for a 15-person team; strangler-pattern domain-by-domain Node → Java migration with zero downtime; productivity gains measured on multiple axes

Experience EXPERIENCE

Tiger EV ENGINEERING MANAGER · TEAM OF 15

Jun 2024 – Jun 2026

EV battery-swap and battery-rental platform across Southeast Asia; unified rider / merchant / supplier product

- ▶ **Built the AI SDD system from zero:** requirements are first turned by AI into templated specs (background / technical design / API contract / test cases — incomplete specs do not proceed); engineers review before any code is written; the spec doubles as the baseline for automated tests and acceptance, then is archived to the knowledge base to feed both AI and new hires. Delivery velocity **+300%** (cross-checked via lead time, iteration throughput, release frequency + rework rate, and measured case studies); production availability **99%**
- ▶ **Ops agent matrix** on the Lark ecosystem, driven by Claude Code + MCP: a log-patrol agent that scans on schedule and pushes alerts proactively; an alert-triggered root-cause agent that reads logs, code and recent releases to produce a localization report; a support agent wired to the enterprise knowledge base for tickets
- ▶ **Led the company-wide Node → Java migration** using a strangler pattern, domain by domain with old and new running in parallel; business stayed online throughout; schedule compressed from 6 to **3 months** with zero major production incidents
- ▶ **Platform architecture:** unified gateway → nginx load balancing → multi-node unified backend (swap / rental / billing / risk); battery cabinets connected via MQTT with a hardware-sync service and task scheduler nodes; async integration with the internal Odoo system over a message queue; in-house Admin for multi-tenant management and operations

Independent Consultant FULL-STACK · SOLO DELIVERY

Jan 2024 – Jun 2024

- ▶ **Nissan China official website (nissan.com.cn):** delivered all three tiers alone — Next.js SSR web (model catalog, dealer lookup, test-drive booking, news), an Antd Pro content-management Admin (models / pages / assets editable by operations), and a Java API service; cleaned and migrated legacy CMS data including images and attachments
- ▶ DeepSeek-based customer-service agent for a hardware-tools business (sales and order follow-up); complete backend / H5 / Admin delivery for a 400K-user health-watch product

Webull · Fumi Technology (Global R&D HQ) CORE DEVELOPER

Jun 2020 – Dec 2023

US online brokerage, 10M+ users, Nasdaq-listed; 7×24 asset-trading platform (webull.com)

- ▶ **Owned account onboarding and compliance:** automated KYC onboarding; risk-tiered trading permissions across stocks, options and margin; a full account-lifecycle state machine with risk controls (abnormal trading, restricted lists); designed the Canada-expansion account system from scratch
- ▶ **Statements / P&L / funding / transfers:** end-of-day batch processing for 10M+ users (daily statements and P&L), end-of-day reconciliation with clearing and banks, multi-channel deposits and withdrawals (ACH, wire), automated ACATS transfers
- ▶ **Clearing migration:** integrated the in-house clearing system that replaced a third party; migrated millions of users with triple safeguards (batched canary cut-over, parallel old/new reconciliation, per-account cash and position verification); **designed the composite routing that layers old/new account identification on top of cell-based sharding**, so the switch was invisible to users with no trading interruption

► **Contributed to the cell-based (unitized) re-architecture and the 7.0 gateway:** each cell is a complete microservice stack (quotes / trading / accounts / risk / funding / P&L) with multi-instance services, cross-region DR, AZ isolation, elastic scaling and task scheduling; a low-spec canary cell serves designated users; a GZone layer handles global aggregation; shared platform base of Consul, unified cache, ES logging, monitoring and distributed tracing; the gateway consolidated five client surfaces

Caohua Interactive **CORE ENGINEER** Mar 2018 – Mar 2020
Unified ad-buying platform for a million-user mobile-game publisher; 30+ media integrations (Toutiao, Tencent Ads, Baidu, UC ...)

- **Ad tracking service** at **6M+** daily / **70M+** peak PV: millisecond accept-only endpoints with parsing, de-duplication and attribution pushed through a message queue to async consumers — no timeouts and no lost billing events at peak
- **Extended MongoDB click-attribution retention from 1 to 7 days** via hot/cold tiering (Redis hot index + MongoDB cold store), sharded cluster with index tuning, compact document schemas, and daily collections with rolling TTL; Redis cluster memory governance (moving click detail out, data-structure redesign, big-key splitting, expiry policies)
- **Built the DMP automation platform from scratch:** audience building and media sync, automated bid and budget control, conversion postbacks driving media-side oCPX, performance reporting; Hadoop / Hive data warehouse
